GeCO – USER JOURNEY

Overview

GeCO

Scenario

Within the interactive installation, the user assumes the role of a reptilian Sneic operative, intent on understanding how to generate maximum suffering from mankind.

User's Goals

–The user (human) wants to undestand GeCO's Function
–The user (reptilian) wants to generate Human Discomfort
–The user (reptilian) wants to create a Tailored Mission for another Reptilian Agent

Phases	1.Access	2.Agent selection	3.Range of action	4.Key Index of Suffering	5.Choose the task	6.See the consequences
Actions	–The user accesses the machine with the badge provided. –GeCO notifies the user that the reptilian user has logged in.	– The user must choose the Agent they want to control – Among them are politicians, entertainment personalities, and entrepreneurs.	– The user must choose the scope within which their task will be executed. – Tasks can be local, regional, or national.	– The user must choose the Key Index of Suffering, that is, the negative emotion, that the task will generate in humans.	–The user must choose the task he prefers from the 3 tasks that GeCO proposes, or restart the generation	–The user looks at the consequences of his chosen task, seeing how many human beings it has caused to suffer.
Experience	The badge holder's distinct physical shape and clear on-screen UI provide strong affordances, making the interaction point immediately intuitive	Agent selection maximizes engagement. Featuring recognizable public figures deepens narrative immersion and subverts their real-world personas.	Knob-based radius selection is a standard technical task. Though low-engagement, physical-digital UI alignment ensures instant intuition	Selecting KIS grants user agency, allowing them to experiment with and directly observe how specific emotions trigger distinct outcomes	Tasks customized by parameters and chosen agents drive high engagement. Users are incentivized to replay and discover new GeCO outputs	Users are rewarded for their office work with metrics of human suffering and fed reptilians, tangibly visualizing their systemic power
Insight	Swiping the badge marks the moment the human steps into the shoes of the reptilian Sneic at the exhibition, setting the starting point.	Users instantly realize reptilians are the elites. They grasp the link between political, economic, or media power and how it directly influences the masses.	By tweaking this value, the user directly changes the scale and magnitude of their event.	This action breaks general "suffering" into micro-themes explored in tasks. It reveals what users pick most, linking specific topics to pain and engagement.	Geco offers 3 distinct tasks based on chosen parameters and agents. The user picks the one they think will cause the most suffering, or just the funniest.	The ending is purposely anticlimactic; *it's office work, after all*. Just a "thank you" and the tally of humans who suffered, proving that evil is banal.
Notes	This iconic office gesture immerses users in the reptilian role. The ID card with name, department, and code hints at the organization's absolute secrecy.	Among them are Giorgia Meloni, the Pope, Carlo Conti, and Fedez. Each is assigned a specific power level, class, and influence rating.	A massive event doesn't always generate huge distress. Users must think like a reptilian to figure out the exact scale needed.	The KIS are: boredom, outrage, panic, distrust, and insecurity.	Tasks range from funny to heavy. Each sheds light on a different aspect of our lives manipulated by the ruling class, prompting the user to investigate.	Notice the disproportion: endless human suffering feeds only a few reptilians. This harsh ratio perfectly explains why the world is going wrong.
